

# Power-Bolt® Heavy-Duty Sleeve Anchor

## PRODUCT DESCRIPTION

The Power-Bolt anchor, is a heavy duty sleeve style, self-locking anchor which is vibration resistant and removable. It is available with a finished hex head or flat head with a hex key insert and can be used in concrete, block, brick, or stone.

Expansion occurs at two locations within the drilled hole. First, the cone is pulled into the large triple-tined expansion sleeve, developing a mid-level, compression force. Further turning causes the threaded bolt to advance into the threads of the expander cone, forcing its four sections outward. This action engages the base material deep in the anchor hole, greatly increasing the holding power of the Power-Bolt. The bolt and cone remain locked together which prevents loosening under vibratory conditions.

The Power-Bolt is also designed to draw the fixture into full bearing against the base material through the action of its flexible compression ring. As the anchor is being tightened, the compression ring will crush if necessary to tightly secure the fixture against the face of the base material.

The internal bolt of the Power-Bolt is removable and reusable in the same anchor sleeve making it suitable for applications such as mounting machinery which may need to be removed for service and for temporary applications such as heavy duty form work.

## GENERAL APPLICATIONS AND USES

- Column Base Plates and Mechanical Equipment
- Dock Bumpers and Support Ledgers
- Racking and Railing Attachments

## FEATURES AND BENEFITS

- + High load capacity
- + Two-level expansion mechanism
- + Internal high strength bolt is removable and reusable
- + Compression zone in sleeve clamps fixture to the base material
- + Low profile finished head design

## TESTING, APPROVALS AND LISTINGS

Tested in accordance with ASTM E488 and AC01 criteria  
 FM Global (Factory Mutual) – File No. J.I. 1K8A3.AH (See report for sizes)  
 Underwriters Laboratories (UL Listed) – File No. EX1289 (See listing for sizes)

## APPROVALS AND LISTINGS

**CSI Divisions:** 03151-Concrete Anchoring, 04081-Masonry Anchorage and 05090-Metal Fastenings. Expansion anchors shall be Power-Bolt as supplied by Powers Fasteners, Inc., Brewster, NY.

**Installation Procedure**

Using the proper diameter bit, drill a hole into the base material to a depth of at least 1/2" or one anchor diameter deeper than the embedment required. The tolerances of the drill bit used must meet the requirements of ANSI Standard B212.15.

Blow the hole clean of dust and other material. Do not modify the anchor or advance the bolt in the anchor assembly prior to installation.

Drive the anchor through the fixture into the anchor hole until the bolt head is firmly seated against the fixture. Be sure the anchor is driven to the required embedment depth.

Tighten the anchor by turning the head 3 to 4 turns past finger tight.

**Nomenclature**

- d* = Diameter of anchor
- d<sub>bit</sub>* = Diameter of drill bit
- d<sub>h</sub>* = Diameter of fixture clearance hole
- d<sub>hd</sub>* = Flat head diameter
- d<sub>w</sub>* = Diameter of washer
- h* = Base material thickness.  
The minimum value of *h* should be 1.5*h<sub>v</sub>* or 3", whichever is greater
- h<sub>v</sub>* = Minimum embedment depth
- l* = Length of anchor
- t* = Fixture thickness

1. Tabulated load values are for anchors installed in concrete. Concrete compressive strength must be at the specified minimum at the time of installation.  
 2. Ultimate load capacities must be reduced by a minimum safety factor of 4.0 or greater to determine allowable working load. Consideration of safety factors of 10 or higher may be necessary depending upon the application such as life safety or overhead.

1. Allowable load capacities listed are calculated using and applied safety factor of 4.0. Consideration of safety factors of 10 or higher may be necessary depending upon the application such as life safety or overhead.  
 2. Allowable load capacities are multiplied by reduction factors found in the Design Criteria section when anchor spacing or edge distances are less than critical distances.  
 3. Linear interpolation may be used to determine allowable loads for intermediate embedments and compressive strengths.

1. Tabulated load values are for anchors installed in sand-lightweight concrete over steel deck. Concrete compressive strength must be at the specified minimum at the time of installation.
2. Allowable load capacities listed are calculated using and applied safety factor of 4.0. Consideration of safety factors of 10 or higher may be necessary depending upon the application such as life safety or overhead.
3. Tabulated load values are for anchors installed in the center of the flute. Spacing distances shall be in accordance with the spacing table for lightweight concrete listed in the Design Criteria section for Power-Bolt.
4. Anchors are permitted to be installed in the lower or upper flute of the metal deck provided the proper installation procedures are maintained.

**DESIGN CRITERIA (ALLOWABLE STRESS DESIGN)**

**Combined Loading**

For anchors loaded in both shear and tension, the combination of loads should be proportioned as follows:

$$\left(\frac{N_u}{N_n}\right)^{\frac{5}{3}} + \left(\frac{V_u}{V_n}\right)^{\frac{5}{3}} \leq 1 \quad \text{OR} \quad \left(\frac{N_u}{N_n}\right) + \left(\frac{V_u}{V_n}\right) \leq 1$$

Where: *N<sub>u</sub>* = Applied Service Tension Load  
*N<sub>n</sub>* = Allowable Tension Load  
*V<sub>u</sub>* = Applied Service Shear Load  
*V<sub>n</sub>* = Allowable Shear Load

1. Allowable load values found in the performance data tables are multiplied by reduction factors when anchor spacing or edge distances are less than critical distances. Linear interpolation is allowed for intermediate anchor spacing and edge distances between critical and minimum distances. When an anchor is affected by both reduced spacing and edge distance, the spacing and edge reduction factors must be combined (multiplied). Multiple reduction factors for anchor spacing and edge distance may be required depending on the anchor group configuration.

Notes: For anchors loaded in tension, the critical edge distance ( $c_{cr}$ ) is equal to 12 anchor diameters ( $12d$ ) at which the anchor achieves 100% of load.

Minimum edge distance ( $c_{min}$ ) is equal to 5 anchor diameters ( $5d$ ) at which the anchor achieves 80% of load.

6987	5/8" x 5 1/2"	5/8"	2-3/4"	15	90	57

The published length is the overall length of the anchor.  
 The flat head Power-Bolt anchor has a hex key insert formed in the head of the bolt.  
 Each box contains an Allen wrench which matches the insert size.
